CMS has uncovered an issue with the muon trigger simulation that impacts particles with $|Q| = e/3$. Consequently, we retract the cross section and mass limits, and related analysis details for $|Q| = e/3$ particles set in [JHEP 07 \(2013\) 122](#). The $|Q| = 2e/3$ results are not affected within the uncertainties. We are supplying in attachment revised plots for figure 10 and figure 11 plus a revised table 8 that have the $|Q| = e/3$ results removed.

Figure 10. Upper cross section limits at 95% C.L. on various signal models for the fractionally charged analysis (left column) and multiply charged analysis (right column). The top row is for the data at $\sqrt{s} = 7 \text{ TeV}$, the middle row is for the data at $\sqrt{s} = 8 \text{ TeV}$, the bottom row shows the ratio of the limit to the theoretical value for the combined dataset.

Figure 11. Lower mass limits at 95% C.L. for various models compared with previously published results [19–26]. The model type is given on the x-axis (left). Mass limits are shown for Drell-Yan like production of fractionally, singly, and multiply charged particles (right). These particles were assumed to be neutral under $SU(3)_C$ and $SU(2)_L$.

Table 8. Expected and observed cross section limits and the signal acceptance for the Drell-Yan like production of fractionally, singly, and multiply charged particles at $\sqrt{s} = 7$ and 8 TeV, as well as the ratio of the cross section limit to the theoretical value for the combined dataset. The minimum reconstructed mass required (M req.) for each sample in the tracker+TOF analysis is also given.
